

AI Use Case Document

HireIQ — Automated Candidate Screening and Ranking System

Executive Summary

HireIQ is an AI-powered recruitment platform that automatically screens, scores, and ranks job applicants for corporate clients. The system processes CVs, cover letters, video interviews, and psychometric test results to produce a ranked shortlist.

System Description

HireIQ uses a transformer-based NLP model to parse CVs and extract skills, experience, and education signals. A multimodal model analyzes video interview footage to assess communication style, confidence, and cultural fit scores. All candidates are assigned a composite Employability Score (0-100).

Users and Affected Persons

Users are HR departments and hiring managers at private companies. Affected persons are job applicants, who are ranked and filtered without human review of individual cases below a threshold score of 60. Applicants below this threshold receive automated rejection emails.

Automation Level

The system operates fully automatically for the initial screening phase. Human recruiters only review candidates who score above 60. No human reviews candidates below the threshold.

Deployment Context

HireIQ is deployed by private corporations across the EU for recruitment in roles including software engineering, logistics, and customer service. Approximately 2 million candidate assessments are processed per year.

Input Data

CV text, cover letter text, LinkedIn profile data, video interview recordings, psychometric assessment results, and historical hiring outcome data.
