

Migration, Asylum, and Border Control Management Systems

- *Industrial Parallel:* Using automated classification pipelines and computer vision to screen applicants, automate entry approvals, and forecast border stresses.
- *The Labeling/Data Crisis:* Shifting political mandates create inconsistent screening labels. Furthermore, the model fails during unprecedented geopolitical conflicts because historical data contains no training labels for those novel realities.
- *Regulatory Risk: High Risk.* Legally requiring third-party audited technical documentation, continuous human-in-the-loop oversight to reverse automated rejections, and zero-bias data transparency.
