

Predictive Crime Modeling Based on Demographic Race Profiles

- *Industrial Parallel:* Treating individual temporal and demographic data like time-series sensor telemetry to predict a physical "failure event" (crime).
- *The Labeling/Data Crisis:* Just as unrecorded machine degradation creates bad training data, systemic human over-policing and bias pollute historical arrest datasets. The model simply automates and optimizes historical human prejudice.
- *Regulatory Risk: **Unacceptable Risk (Strictly Banned)**.* Systems that profile or predict criminal risk based on race, personality, or socioeconomic standing are illegal under democratic legal frameworks as they violate fundamental human dignity and the presumption of innocence.
